## I. Definition of Terms

Instruction: Encircle the correct answer.

1. Mitre saws that have the benefit of tilting the blade and head at various angles to the workpiece.

   A. Compound
   B. Sliding Compound
   C. Railing
   D. Sliding Ra

2. A type of mitre saw that adds rails to let the saw blade slide front to back across the workpiece.

   A. Compound
   B. Sliding Compound
   C. Railing
   D. Sliding Rail

3. Refers to the space between each tooth on the blade. The wider it is the bigger chip of material cut.

   A. Cutting Blade
   B. Gullet
   C. Metal Chips
   D. Bevel

4. Refers to the angle of the tooth in relation to the centre line of the blade. It can be positive or negative.

   A. Turn Angle
   B. Tap Angle
   C. Tooth Angle
   D. Tool Angle

5. Cutting blade with smaller gullet that yield more teeth for smoother cut.

   A. Rip Blade
   B. Saw Blade
   C. Cutter Blade
   D. Crosscut Blade

6. Cutting blade with larger gullet that yield fewer teeth for cutting along grain flow.

   A. Rip Blade
   B. Saw Blade
   C. Cutter Blade
   D. Crosscut Blade

7. A sudden reaction to a pinched, bound or misaligned saw blade, causing an uncontrolled saw to lift up and out of the workpiece toward the operator.

   A. Broken Saw
   B. Lift Back
   C. Kick Back
   D. Kick Track

8. The shape of the blade teeth also determines its performance. Teeth are configured to optimize crosscutting, ripping, and working through certain materials, like laminates, MDF, etc.

   A. Tooth Configuration
   B. Tooth Description
   C. Tooth Subscription
   D. Tooth Destination

9. Kind of band saw that runs the blade from the top down pulling material off the workpiece and towards the table. These saws lend themselves to smaller parts that can easily be manually manipulated.

   A. Top Band Saw
   B. Parallel Band Saw
   C. Vertical Band Saw
   D. Horizontal Band Saw

10. This Pivot style saw adds a less expensive design and typically utilizes gravity or hydraulic force to feed the head.

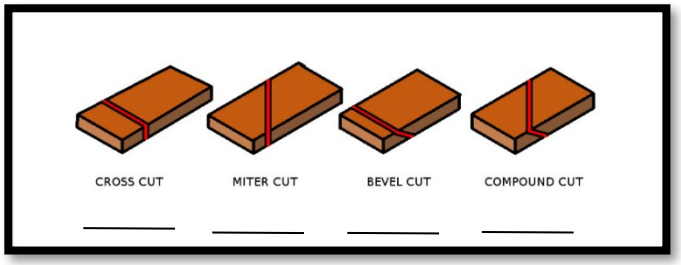
    A. Top Band Saw
    B. Parallel Band Saw
    C. Vertical Band Saw
    D. Horizontal Band Saw

11. Varying set angles and gullet depth reduces vibration. All-purpose blade for production work and cut offs.

    A. Standard Tooth
    B. Skip Tooth
    C. Variable Tooth
    D. Hook Tooth

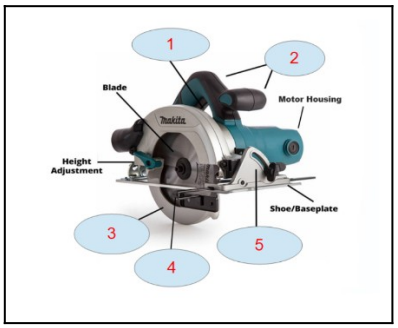
## II. Identification

Instruction: Identify the four kinds of cut



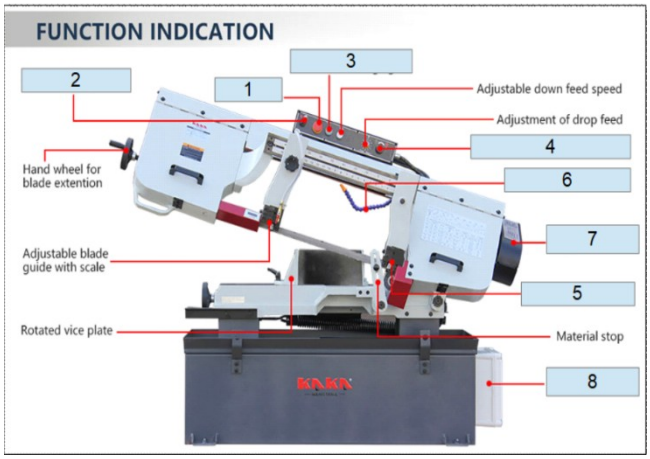
Instruction: Identify the parts of circular saw machine.

1. _____
2. _____
3. _____
4. _____
5. _____

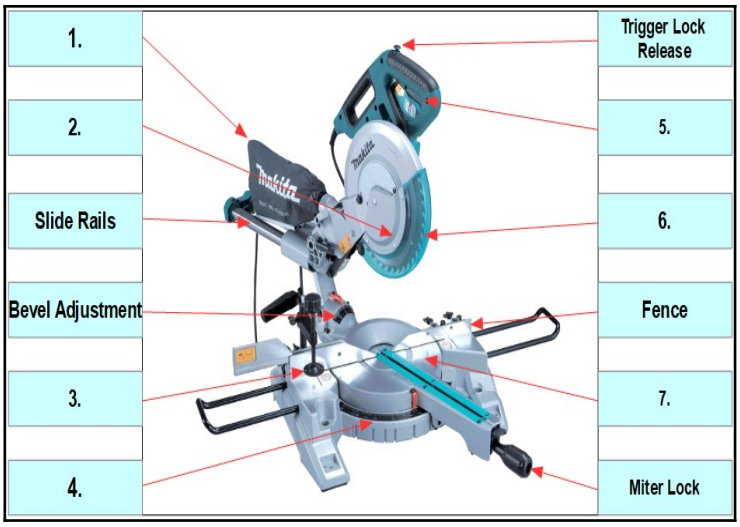


Instruction: Identify the parts of Horizontal band saw machine.

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____
8. _____



1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____



## III. Enumeration

Instruction: List down the Vertical Band Saw Operation

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____

Instruction: List down 2 things that you should not wear while operating a machine.

1. _____
2. _____

Instruction: Give at least 6 Personal Protective Equipment (PPE).

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____

**FOR CERTIFICATION**

| SCORE | INTERPRETATION | ASSESSMENT |
|---|---|---|
| ☐ 75% - 100% | Passed | Technical Employees have successfully shown that they have acquired the necessary knowledge and skills to be certified. |
| ☐ 74% - Below | Failed | Technical Employees did not meet the criteria for certification. |

**FOR RECERTIFICATION**

| SCORE | | INTERPRETATION | ASSESSMENT |
|---|---|---|---|
| ☐ AS *(Cumulative)* 81% - 100% | ☐ ISO 90% - 100% | Passed | Technical Employees have successfully demonstrated that they still possess the necessary knowledge and skills required for the certification. |
| ☐ AS *(Cumulative)* 80% - Below | ☐ ISO 89% - Below | Failed | Technical employees do not meet the required standards to maintain their certification. |
